

shigeki yamamoto's plug and screw play cabinet imitates childhood construction

the berlin-based designer shigeki yamamoto launches 'play cabinet' – a new piece from his series of works reminiscent of a construction kit for children. several years ago, working on a table lamp, the designer came up with a concept, which now, as he says, lets him work 'more freely'.

the idea is that when **yamamoto** designs an object, he uses plug and screw connections, so, when assembling the details, he can attach each one almost everywhere. this technique was also applied to 'play sidebar' – his last project which was launched in 2016.

'with every project, I find new opportunities and ways to apply my concept', the designer explains. 'I always knew that I wanted to use this technique to create even more complex structures. 'play cabinet' represents the current peak of my journey, that is still far from the finish.'
